Dear Prof. Suchy,

you sent me two publications about your new developed Technological knowledge base " Simulation DB " and "Master DB" .

This new tools for the foundry engineering departments is very useful for the whole worldwide foundry industry, special for the European foundries with their high standard of computer based engineering. The simulation of foundry processes like solidification, heat treatment, calculation of runners and risers, prediction of mechanical strengths, core shooting etc. is the most important innovation in the last twenty years. Step by step, the European foundries established this technology in their companies. With the years a lot of individual data are developed. But until today, there is no existing tool for a systematic storage, reuse of successful information and methods for reusing individual information from the past to fasten the process time of the new projects. This lack can be closed with your new data management tools and will shorten the development process in the foundries dramatically.

Your data management tools are very interesting for a scientific and a commercial use too.

The first market for the data base programs will be the European market with more than 2000 industrial foundries, the American and Asian foundries are although on the technological level to use this software.

If you are thinking to commercialize this product, the next step should be a detailed market research project for the European market. If you are interested, we can do this for you. RoelfsPartner, one of the largest management consultants companies in Germany is very familiar with the foundry industry in Europe and with market studies like this. We have done a lot of market studies in the foundry branch in the last years.

Don't hesitate to contact us if you are interested to cooperate.

With best regards

Prof. Dr.-Ing.
